The creation of ChatGPT inspired many new Large Language Models after it such as Google's Bard and Microsoft's Copilot. However, not all inspirations may be for the best.

WormGPT is a chatbot created with the aim of aiding cybercriminals carry out their malicious activities quicker and easier. It is pretty much ChatGPT with the parental controls off.

The chatbot is based on GPT-J, an open-source large language model back in 2021. The chatbot was supposedly trained by the creator using various data sources, particularly malware-related data.

According to <u>PCMag</u>, the developer uploaded screenshots indicating the bot could write malware in the Python programming language, alongside tips on creating malicious attacks ...

However, the main feature of concern is it's ability to write emails for Business Email Compromise (BEC) attacks and other phishing schemes. The chatbot has the ability to create what one could call the perfect phishing email. No errors or mistakes, making it easier to carry out social engineering.

Luckily, with great power comes a greater price ❖. <u>PCMag</u> also reports that access to the bot goes for €60 (about ¥53,000) per month. <u>Cloudbooklet</u> also notes that the subscription has to be paid in cryptocurrency which would of course add some extra fees to the mix.
